FOR DISCUSSION · MDEC AND JOHOR STATE IT

Shaping Johor's next steps, together.

How we can help **shape, define and deliver** what comes after the data lake.

OrangePay · October 2026

FROM THE FINDINGS

Three findings shape how this should be delivered.

1

The order matters

Process and data foundations come before platforms and AI. Skipping ahead is how projects go idle.

2

The critical path is governance

A state data-sharing framework, and agreement across 16 councils. Neither of these is a software problem.

3

Delivery must expect change

With consensus across councils and new priorities from the data-centre boom and the SEZ, direction will shift.

So the delivery approach must keep the state in control, and make changing direction cheap.

WHERE WE CAN HELP

We can help at three points: shape, define and deliver.

Shape

Decide what to do first

- Run the validation workshop
- Set the "one visit" baseline for the top council services
- Help choose the pilot councils
- Line up the federal and state path with MDEC

Define

Make each service clear

- Map priority services as clear process flows and business rules
- Agree them with the people who own them
- Keep one record that design, build and run all share

Deliver

Turn definitions into services

- Build quick wins on the data lake first
- Then the foundations, one service at a time
- Train state and council officers to own the result

THE USUAL RISK

The usual risk: the definition is locked in before anyone has learned.

Specify
a long specification, written up front

→

Tender
and contract against it

→

Build
for months

→

The need has moved
by go-live

→

Change costs
a variation order, or a rewrite

What China's failures show

Turnkey smart-city packages went idle within months when priorities moved or data was not shared. Technology placed on top of unchanged processes delivered little.

Why it matters more in Johor

Sixteen councils deciding by consensus, plus fast-moving demands from the data-centre boom and the SEZ, mean the definition will change during delivery.

OUR APPROACH

You focus on the definition and the governance. The build won't be the bottleneck.

THE STATE AND COUNCILS OWN

- What each service should do, and for whom
- The rules, and who approves them
- Data-sharing agreements, and getting the councils on board

WE CARRY, WITH HYALO

- Turning approved definitions into running services
- Keeping design, build and run in one record
- Making each change quick to apply, check and approve

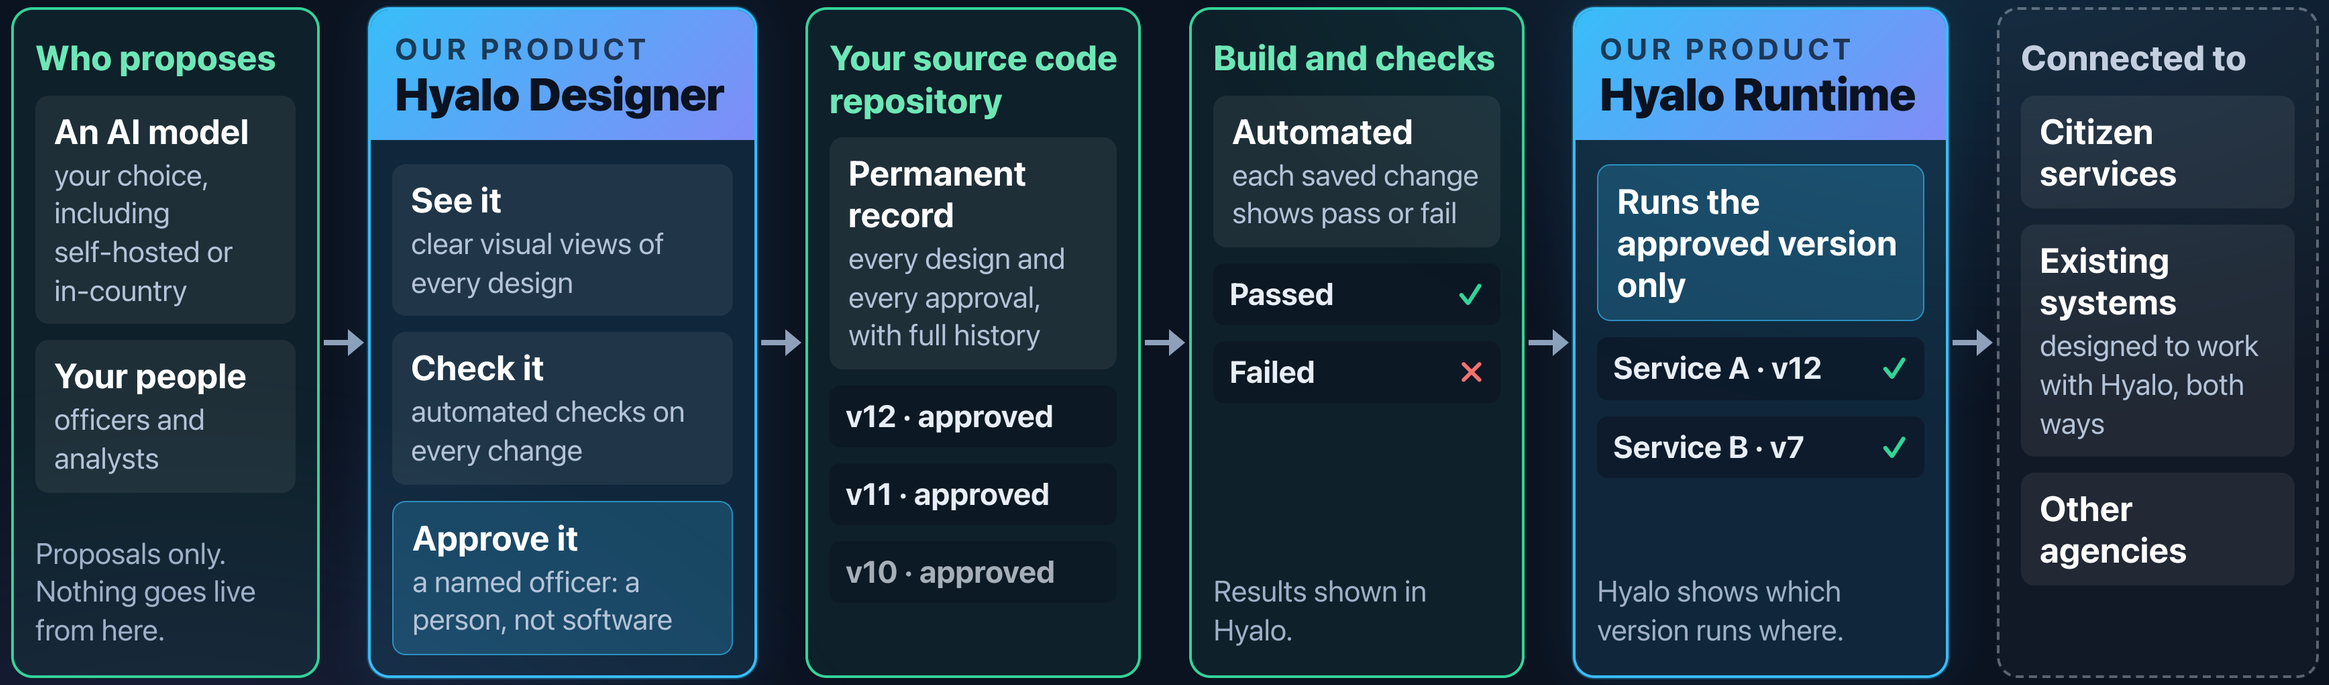

When direction changes, you change the definition. You don't start again.

HYALO IN ONE PICTURE

Hyalo is where every change is seen, approved and run.

No change goes live without an officer's approval, and every approval is recorded.

Yours · Hyalo

Hyalo has two parts: Hyalo Designer, where changes are seen and approved, and **Hyalo Runtime**, which runs the approved designs.

ILLUSTRATIVE EXAMPLE

When a renewal rule changes, Johor doesn't start again.

Every step uses what works today. It shows how the approach works; it is not a customer case study.

1

POLICY

The state adds a check before a business licence can be renewed automatically.

2

OFFICER

An officer updates the rule in Hyalo's visual rule view, with no new tender.

3

HYALO

Automated checks run, and Hyalo shows the result.

4

SERVICE OWNER

The accountable owner approves. **The approval is recorded.**

5

HYALO RUNTIME

The new version runs. The previous version stays on record.

> **The record shows what changed, who approved it, and which version each service runs.**

In progress Next: AI drafts the change for the officer to review, fix and approve.

IN MDEC'S TERMS

This is MDEC's "agentic transformation" stage, applied to government.

STAGE 1

Agentic build

AI helps build software

STAGE 2

Agentic SaaS

AI replaces software subscriptions

STAGE 3

Agentic workforce

AI takes on routine roles

STAGE 4

Agentic transformation

workflows redesigned, not just assisted

"One visit" baseline

Redesign each council process around fewer visits and documents.

Instant approval

Rules that can run automatically, with a manual fallback.

Life-event bundles

One process across agencies, such as "build a data centre in Johor".

AI proposes the redesign. A responsible officer approves it. Every step is recorded.

Stages as described by MDEC's chairman at MDX Forum 2026 (28 September 2026).

WORKING ALONGSIDE

Designed to work with what's already there.

OSC 3.0 Plus, council systems, IMFC-J and the state data lake keep running. Nothing is thrown away.

Your systems use Hyalo

Existing applications are designed to use new Hyalo services as if they were their own.

Hyalo uses your systems

New services reuse what existing systems and the data lake already do well.

No rewrite of what works

Start with one service in one council, then move problem areas one at a time.

Counters stay open. Counter staff can file on the same digital process on a citizen's behalf, so paper disappears behind the counter.

OUR STARTING POSITION

Our starting position on the board's first questions.

Hosting and data residency

Proposed

Hyalo Runtime and your source code repository run in your environment, in-country: your own cloud or on-premise.

AI model

Proposed

Your choice of model, including self-hosted or in-country compute, such as through MDEC's planned National AI Compute Exchange.

Security

Proposed

Align to the government's security framework, with independent security testing before any live use.

Procurement

Proposed

Start small, at a scope that fits simple procurement routes.

Skills and support

Proposed

We work alongside state and council teams at the start, and train officers to review and approve changes.

Continuity and exit

Proposed

Designs and their full history stay in your repository. We propose source-code escrow for Hyalo Runtime.

These are proposals, not terms. We'd rather refine them with you than assume them.

NEXT

A proposed first step, and the team.

A first step

[TO CONFIRM: paid discovery, joint proof of concept, or workshop]

One quick win, in one or two councils, measured against a baseline agreed up front.

What we'd need from you

- An introduction to the data lake owner
- A named service owner who can approve
- One council willing to go first

The team

Three founders, each with **20+ years designing, building and running critical national-scale systems.**

CEO · Design
international data standards; led a national real-time system used by the public

CTO · Build
repeatedly relied on to deliver complex systems on very short timelines

Operations leader · Run
a former CIO who ran large teams supporting critical 24x7 systems
